

Secure Diversity Survey - Detailed Questions and Answers

Document type	Research FAQ
Coverage	Cultural Infusion Atlas - synthetic research snapshot
Topics	FAQ secure survey anonymity trust privacy notice data minimisation
Source inspiration	https://atlas.culturalinfusion.com/secure-diversity-inclusion-survey-trust/

This document is a synthetic test artifact derived from themes and publicly visible metadata in the supplied Atlas article. It contains paraphrase, explanatory expansion and invented scenarios. It is not legal advice, a real client record, or a substitute for the original source and linked academic paper.

Is an anonymous survey the same as a confidential survey?

No. Anonymous ordinarily means responses cannot reasonably be linked to an individual, while confidential means a link may exist but access and use are restricted. A survey using personalised invitation tokens may be confidential or pseudonymous during collection even if reports are anonymous at publication.

The distinction should be explained plainly. Calling a survey anonymous while retaining an accessible identity mapping can damage trust and create legal risk.

Does encryption make a survey anonymous?

No. Encryption protects information from parties without the necessary key or permission. Once decrypted for an authorised user, the content may still identify a respondent directly or through context. Anonymity also depends on collected fields, cohort size, free text, report filters and external knowledge.

Why collect identity data at all?

Identity data can reveal whether experiences and opportunities differ across groups, support targeted inclusion work and help monitor change. Collection is justified only when tied to a clear purpose and proportionate method. More categories do not automatically create better insight, especially in small workforces.

What should a respondent notice contain?

A useful notice identifies the responsible organisation, purpose, voluntary nature, question types, recipients, reporting safeguards, retention, transfers, individual rights, complaint route and contact. Layering allows a concise overview with access to detail. Technical language should be translated into its practical effect.

Can managers track who completed the survey?

Campaign systems may track whether an invitation was delivered or completed without revealing answers. If completion status is visible to managers, the design should consider coercion and retaliation risk. The fictional governance model keeps reminder operations separate and does not expose raw answers to line managers.

What is data minimisation?

Data minimisation means collecting and retaining only what is adequate, relevant and necessary for the approved purpose. It can involve removing fields, reducing precision, shortening retention, limiting free text and avoiding duplicate collection from other systems.

How are small groups protected?

Common controls include minimum reporting thresholds, complementary suppression, restricted cross-tabs, query monitoring and review of exports. A threshold is not sufficient if repeated or overlapping queries can isolate a person. Organisational context matters because colleagues may already know team composition.

What is differential privacy?

Differential privacy is a mathematical framework that limits how much an output depends on one person's record. Implementations often add calibrated noise and manage a cumulative privacy budget. It is most useful when the release model and accuracy trade-offs are understood.

Are global privacy laws all the same?

No. They share themes such as transparency, purpose, security and individual rights, but definitions, legal bases, sensitive-data rules, employment provisions and transfer mechanisms vary. The regulatory matrix in this corpus is a research starting point, not legal advice.

What happens after a breach?

The organisation should contain the issue, preserve evidence, determine affected data and people, assess harm and notification duties, communicate accurately and fix root causes. Notification timing and content depend on applicable law and contracts. Privacy and security specialists should guide the response.

Can Bob inspect the live Atlas website?

In this local RAG implementation, Bob answers from a promoted static index. He does not browse or refresh the live website during each chat. Content must be crawled, validated, chunked and promoted before it becomes available to retrieval.

Which content is real and which is synthetic?

The supplied article title, page metadata, named themes, technologies, laws and linked-paper metadata are derived from the public page. Extended studies, organisations, metrics, thresholds, retention schedules, incident details and architecture findings in this corpus are fabricated for evaluation.
